#### ALIGNMENTS

AAW34156 standard; peptide; 20 AA (revised)
(first entry) GTF antigenic peptide #1. 25-MAR-2003 18-FEB-1998 AAW34156; RESULT 1 AAW3415 

Glucosyltransferase; GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain; immune response; glucan-binding activity; dental caries prevention.

Streptococcus mutans

US5686075-A.

11-NOV-1997.

93US-00057162. 30-APR-1993;

92US-00877295 01-MAY-1992; (FORS-) FORSYTH DENTAL INFIRMARY FOR CHILDREN.

Smith DJ, Taubman MA;

WPI; 1997-558089/51.

Immunogenic compositions containing streptococcal glucosyl:transferase peptide(s) - used for provoking immune response to streptococcal glucosyl:transferase for preventing dental caries.

Claim 1; Col 13; 11pp; English.

AAW34156-W34160 represent immunogenic fragments of the Streptomyces mutans glucosyltransferase (GTF) enzyme. AAW34157 and AAW34158 are from the catalytic domain of GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159 are from the glucan-binding domain of GTF. These sequences can all be used in the immunogenic composition of the invention. The composition of the invention can alternatively comprise one or more of these sequences linked to a lysine core matrix (see AAW34161-W34165). A composition comprising one of these sequences can be administered to a mammal to raise an immune response, in a method for interfering with the enzymatic activity of streptococcal

```
This sequence represents a glucosyltransferase (GTF) immunogenic epitope, and can be used in the immunogenic composition of the invention. The immunogenic composition (A) comprises at least one streptococcal glucan (SG) and at least one component (1) covalently coupled, (in)directly, to (SG. (A) elicits antibodies (Ab) to both SG and (1). (A), and related compositions, are used to induce an antibody response to cariogenic bacteria, collectively called "mutans streptococci" (i.e. any of the preparation, to reduce numbers of bacteria or to reduce to prevent colonisation, to reduce numbers of bacteria or to reduce incidence of caries, in humans or other animals. The composition can therefore be used for the treatment or prevention of caries (particularly dental caries). Abs raised against (A) can be used: (a) to detect SG, and (b) for passive immunisation, e.g. applied directly to the surface of teeth. SG is a poorly immunogenic type 2 T-cell independent antigen but when coupled to (I) it produces a conjugate which induces significant immunity to both components, resulting in immunological memory and long-lasting antibody production against SG, in adults and children
                                                                                                                                                                                                               ö
glucosyltransferase in a mammal. The immune response results in reduction of the colonisation or accumulation of mutans streptococcal strains in the mammal. Compositions containing AAW34156 specifically interfere with the glucan-binding activity of the streptococcal glucosyltransferase. The peptides can also be used in vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GTF; antigenic epitope; glucosyltransferase; immunogenic epitope; teeth; immunogenic composition; streptococcal glucan; antibody response; cariogenic bacteria; mutans streptococci; colonisation; caries; dental caries; immunisation; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunogenic compositions for control of dental caries, based on
Streptococcus mutans components, particularly for vaccination of infants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of a glucan binding domain peptide fragment of Streptococcus mutans glucosyltransferase. The peptide can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II protein-binding peptide from Streptococcus mutants glucan binding protein-Bickpbb covalently linked with a peptide subunit of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Diepitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised againet MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                      Streptococcus mutans glucosyltransferase glucan-binding domain peptide.

AAW34161-W34165 represent the Streptomyces mutans glycosyltransferase

(GTF) enzyme immunogenic fragments shown in AAW34156-W34160 linked to a

polylysaine core. AAW34157 and AAW34158 are from the catalytic domain of

GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159

are from the glucan-binding domain of GTF. These sequences, and the

immunogenic fragments shown in AAW34156 W34160 can all be used in the

immunogenic composition of the invention. A composition comprising one of

these sequences can be administered to a mammal. The immune response

response, in a method for interfering with the enzymatic activity of

streptococcal glucosyltransferase in a mammal. The immune response

results in reduction of the colonisation or accumulation of mutens

streptococcal strains in the mammal. Compositions containing AAW34156

specifically interfere with the glucan-binding activity of the

streptococcal glucosyltransferase. The peptides can also be used in

vaccines for preventing dental caries in mammals. (Updated on 25-MAR-2003)
                                                                /label= GTF antigenic peptide #1 (see AAW34156)
/note= "attached to the dendritic polylysine core via the alpha-amino group of Lys(21); a second copy of the antigenic 20-mer is linked to Lys(21) via the omega amino group"
                                                                                                                                                                                                                                                                                                                          /note= "the alpha amino acid group of Lys(22) forms a peptide linkage with the carboxyl amino group of Lys(21); the omega amino group of Lys(22) forms a peptide bond with a second Lys residue analogous to Lys(21)"
                                                                                                                                                                                                                 s copy of the antigenic group, and to a second via the omega amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic compositions containing streptococcal glucosyl:transferase peptide(s) - used for provoking immune response to streptococcal glucosyl:transferase for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 22;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MrC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB-derived peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glucosyltransferase; GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain; immune response; glucan-binding activity; dental caries prevention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             region of a high molecular weight microbial cell-surface layer profess of Streptococcus sobrinus, and a glucan-binding region of glucan synthetase. Also described is a recombinant DNA encoding the fusion protein of the invention, an expression vector containing the recombinant DNA, a transformed host containing the expression vector, and an antibody formulation containing the antibody with respect to the fusion protein. The fusion protein and the antibody with respect to the fusion protein. The fusion protein and the antibody formulation of the invention are protein allows the inhibition of adhesion of microorganisms such as S. sobrinus on the surface of teeth, and induces phagocytosis of microbial cells, and thus prevents dental caries in an individual. This sequence represents a protein relating to the present invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                      Fusion protein; microbial cell-surface layer protein; glucan synthetase; recombinant DNA; antibody production; dental caries; tooth; phagocytosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fusion protein useful for preventing dental caries, comprises alanine-repeat region of high molecular weight microbial cell-surface layer protein of Streptococcus sobrinus, and glucan-binding region of glucan synthetase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a fusion protein comprising an alanine-repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Glucosyltransferase; enzyme; vaccine; anticaries; epitope; immunogen.

The present sequence is the protein sequence of Streptococcus sobrinus glucosyltransferase-I (GTP-I). Peptide fragments of GTP-I, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions binding peptide from S. mutants glucan binding protein-B (GppB) binding peptide from S. mutants glucan binding protein-B (GppB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                 Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The DNA sequence from Streptococcus sobrinus strain 6715 encodes glucosyltransferase-I (and mutants). The DNA was obtd. by treating S. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUCI8 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used
                                                                                                                                                                            The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus sobrinus GbpB protein of the invention.
                                                                                                New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence glucosyl:transferase-I - comprises Streptococcus sobrinus sequence with at least one nucleotide added or deleted.

The can be used to produce a vaccine comprising 2 of these sequences attached to a peptidyl core matrix. They are useful in producing T-cell responses to the GT enzyme causing a reduction of colonisation or accumulation of mutans steptococcal strains in mammals. The vaccines can be used in preventing dental caries. (Updated on 25-MAR-2003 to correct PN field.)

site of the active centre zone of a dextran sucrase for the active centre zone of different types of dextran sucrase. Glucan is a polysaccharide (for example dextran) which uses Delucases, such as a starch and a cellulose, as a structural unit. The modified enzyme of the invention is useful in the manufacture of glucan. The selection of the active centre area of DS which carries out transduction, enables changes in structure and character of an enzyme-reaction product and their application to various uses. The present sequence is that of a protein which is related to the Leuconsotoc meenteroides dextran sucrase protein and which was need directly assembled.
                                                                                                                                                                                                                                                                                                                                                                                                          Novel modified dextran sucrase which exchanges one site of active center zone of dextran sucrase for active center zone of different types of dextran sucrase, useful for manufacturing glucan.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a modified dextran sucrase (DS) exchanging one
                                                                                 dextran sucrase; active centre zone; glucan; polysaccharide; dextran;

C The Invention an Isolated protein comprising a glucosyltransierses (GFF) (GF 1901) and No. 1902 protein comprising a glucosyltransierses (GFF) (GF 1901) and No. 1903 protein comprising the polypeptide having changes at positions from T480, T580K, M4710, CG (GFF 1901) polypeptide having changes at positions from T880, T580E, M4710, CG (GFF 1901) polypeptide having changes at positions from T880D, T580E, M4710, M4710/T589D, and M4710/T589E. Also included are a glucan produced by the GFF putch, an isolated polymucleotide which encodes P1 or P2, or its complementary polymucleotide, a tribomucleic acid sequence encoding the GFF mutant, an expression cassette comprising the polymucleotide operably linked to a promoter, a vector comprising the polymucleotide operably linked to a promoter, a vector comprising the polymucleotide operably linked to a promoter, a vector, a transgenic plant, a paper sizing and/or occing composition comprising a glucan produced in the amyloplast and/or vector, a latex, the glucan is produced in the amyloplast and/or vector is carried and of the comprising the glucan grapher sizing/coating agent). The vector is useful deficient in starch biosynthesis, transformed with a gene encoding a glucan (paper sizing/coating agent). The vector is useful comprising the glucan in a plant. The method comprises transforming a glucan in a plant. The method comprises transforming conditions to produce a regenerated plant and inducing expression of the polymucleotide for a time sufficient to produce a transgenic plant, and glucan conditions to produce a transgenic plant, and conditions are useful as substitutes for and additions to modified starch require input materials that produce deficient of the vector contains are useful as substitutes for and additions to modified starch require input materials that produce deficient of which with the produced of the plant manner of the produced of the plant manner of the produced of the plant manner of the plant produced by the pract of the plant plant of the plant 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         environmentally friendly. Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence represents GTFC
                                                                                                                                                                                                                                                                                                                                                                                        Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in paper manufacture, comprises mutations in specific positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention an isolated protein comprising a glucosyltransferase (GTF)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
The present sequence is the protein sequence of Streptococcus mutans glucosyltransferase-C (GTF-C). Peptide fragments of GTF-C, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions binding peptide from S. mutants glucan binding protein-B (GppB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multispitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                              Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunogenicity; immune stimulation; glucan binding protein-B;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutuas, particularly mouse-hybridoma MHP126 (FERM P-17566) or mouse-hybridoma MHP136 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This sequence represents a Streptococcus mutans monoclonal antibody-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti-caries agent composed of a monoclonal antibody against an inhibitory enzyme against water insoluble glucan synthetase of glucosyl transferase-B (GTF-B) of Streptococcus mutans.
                                                                                                                             Antibody; dental caries; water insoluble glucan synthetase; anti-caries; glucosyl transferase-B; immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glucosyltransferase; enzyme; vaccine; anticaries; epitope; immunogen.

PT (GDBB) that binds to MHC class II protein, and a biocompatible
PT (GDBB) that binds to MHC class II protein, and a biocompatible
PT microparticle, useful for producing an antibody (claimed) for immunizing
PT mammals against dental caries.

XX
PS Claim 7; SEQ ID NO 35; 73pp; English.

XX
CC The invention relates to a composition comprising a fragment of a glucan compatible microparticle, where the binding protein-B (GDpB) and a biocompatiblity complex (MHC) class II cortein. The composition is useful for producing an antibody for immunizing mammals against dental caries. L. FUNCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because of their ability to adhere to smooth surfaces and mediate the aggregation of bacterial calls and food debris.

C. TATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl) (n) = D-functose + (1,6-alpha-D-glucosyl) (n+1).

T. SUBCELLANGOUS: GTF-I synthesizes water-insoluble glucans (alpha 1,3-linked glucans (alpha 1,6-glucose). GTF-SI synthesizes water-soluble glucans (alpha 1,6-glucose). GTF-SI synthesizes both forms of glucans.

J. Jalinked Subcass to the glycosyl hydrolase 70 family.

L. SIMILARITY: Belongs to the glycosyl hydrolase 70 family.

L. SIMILARITY: Contains 19 cell wall binding repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This Swiss-Prot entry is copyright. J. Bacteriol. 169:4263-4270(1987).

L. FONCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because of their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.

C. TATALYIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl)(n) = D-fluctose + (1,6-alpha-D-glucosyl)(n+1).

C. SUBCELLANEOUS: GTF-I synthesizes water-insoluble glucans (alpha 1,3-linked glucose and some 1,6 linkages), GTF-S synthesizes both

Learn ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.

CATALYTIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl) (n) = D-fructose + (1,6-alpha-D-glucosyl) (n+1).

CATALYTIC ACTIVITY: Secreted.

MISCELLANBOUS: GTP-I synthesizes water-insoluble glucans (alpha 1,6-glucose). GTF-S synthesizes water-soluble glucans (alpha 1,6-glucose). GTF-S synthesizes both forms of glucans (alpha 1,6-glucose). GTF-SI synthesizes both forms of glucans (alpha 1,6-glucose). GTF-SI synthesizes both forms of glucans (alpha 1,6-glucose). GTF-SI synthesizes both forms of glucans (alpha 1,6-glucose). GTF-SI synthesizes SIMILARITY: Belongs to the glycosyl hydrolase 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This Swiss-Prot entry is copyright.                                                                                                                                                                                                                                                                           Proc. Natl. Acad. Sci. U.S.A. 99:14434-14439(2002).

-!- FUNCTION: Production of extracellular glucans, that are thought to play a key role in the development of the dental plaque because their ability to adhere to smooth surfaces and mediate the aggregation of bacterial cells and food debris.
-!- CATALATIC ACTIVITY: Sucrose + (1,6-alpha-D-glucosyl)(n,1).
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- MISCELLAMOSUS: GFF-I synthesizes water-insoluble glucans (alpha 1,3-1.nked glucose and some 1,6 linkages), GFF-S synthesizes water-soluble glucans (alpha 1,6-glucose). GFF-SI synthesizes both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         InterPro; IPR002479; Cell wall bd put.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description

Application US/08793824

Patent No. 598138

GENERAL INFORMATION:

APPLICANT: Simpson, Christine Lynn
APPLICANT: Jacques, Nicholas Anthony
ITITLE OF INVENTION: Genetic Manipulation of Plants to
TITLE OF INVENTION: Increase Stored Carbohydrates
NUMBER OF SEQUENCES: 2

CORRESPONDENCE ADDRESS:

ADDRESSEE: Griffith Hack & Co
STREET: Level 8, 168 Walker Street

CITY: No. 5981838th Sydney

STATE: New South Wales
                                                                                                                                       5; Indels
